【摘要】 目的 分析呼吸道合胞病毒(respiratory syncytial virus, RSV)感染住院儿童的临床特征,探究其影响因素。方法 通过医院信息系统筛选 2010—2014 年期间于苏州大学附属儿童医院住院的 5 岁以下急性下呼吸道感染(acute lower respiratory infection, ALRI)病例,从病历中收集 ALRI 住院病例的临床诊治、生化检测资料,通过实验室检测信息系统获取其 RSV 检测结果。比较 RSV 阳性和阴性 ALRI 病例的临床特点,采用非条件 Logistic 回归分析模型分析 RSV 感染的影响因素。结果 19 257 名 ALRI 病例中,4 096 例 RSV 检测结果阳性,阳性率为 21.3%。RSV 阳性 ALRI 患儿的常见症状为咳嗽(99.4%)、咽痛/咽红(98.3%)、喘息(60.9%)。与 RSV 阴性患儿相比,RSV 阳性患儿喘息、气促发生率均较高(均有 $P < 0.001$),发热率低($\chi^2 = 280.8$, $P < 0.001$)。低年龄是 RSV 感染的独立危险因素,与 24~<60 月龄儿童相比,1~<6 月龄、6~<12 月龄、12~<24 月龄儿童感染 RSV 的调整比值比分别为 4.00(95% CI: 3.57~4.48)、2.60(95% CI: 2.30~2.94)、1.82(95% CI: 1.59~2.07)。结论 RSV 感染患儿喘息、气促的发生率较高;低年龄是 RSV 感染的独立危险因素,年龄越小,感染 RSV 的风险越高。

【Abstract】 Objective To analyze the clinical characteristics of hospitalized children with respiratory syncytial virus (RSV) infection and explore the influencing factors in RSV infection. **Methods** First of all, the Hospitalization Information System was applied to retrospectively screened the children with acute lower respiratory infection (ALRI) who got hospitalized in Suzhou University Affiliated Children's hospital (SCH) from 2010 to 2014. Then, the detailed data in relation to their clinical diagnosis, treatment and biochemical test was collected from the medical records of ALRI inpatient and the results of their RSV tests were obtained from the Laboratory Information System. Upon a comparison drawn in clinical characteristics between RSV positive and negative ALRI cases, non-conditional Logistic regression
